The circuit of a voltage stabilizer basically consists of a voltage sensor. It is configured to detect the rise or fall of the AC mains voltage to dangerous levels. As soon it senses a risky input voltage, it immediately energizes the relays connected to it. These relays in turn swaps and switches the appropriate winding terminals of the auto transformer to correct and stabilize the output voltage.

An autotransformer is an electrical transformer with only one winding.The "auto" (Greek for "self") prefix refers to the single coil acting alone, not to any kind of automatic mechanism.In an autotransformer, portions of the same winding act as both the primary winding and secondary winding sides of the transformer. In contrast, an ordinary transformer has separate primary and secondary ...

A stabilizer transformer is also known as a constant voltage transformer, which is a form of a saturable reactor. I happen to have one to show you. As you can see, it has two separate winding sections with a magnetic shunt between them. The primary is the smaller section on the right.

transformer must be withstand the variation of the maximum input voltage is 242 V ? 250 V and the minimum input voltage is 132 V ? 130 V. The output voltage must be nearly 220 V. Variable transformer type of this AVS is toroidal transformer. The capacity of automatic voltage stabilizer is 15 kVA (single-phase).
