About this course. 6.341x is designed to provide both an in-depth and an intuitive understanding of the theory behind modern discrete-time signal processing systems and applications. The course begins with a review and extension of the basics of signal processing including a discussion of group delay and minimum-phase systems, and the use of discrete-time (DT) systems for processing of continuous-time (CT) signals.

When a discrete-time signal is obtained by sampling a sequence at uniformly spaced times, it has an associated sampling rate. Discrete-time signals may have several origins, but can usually be classified into one of two groups: By acquiring values of an analog signal at constant or variable rate. This process is called sampling. By observing an inherently discrete-time process, such as

Discrete time and continuous time - Wikipedia

•In its most general form, DSP refers to the processing of analog signals by means of discrete-time operations implemented on digital hardware. •From a system viewpoint, DSP is concerned with mixed systems: - the input and output signals are analog - the processing is done on the equivalent digital signals.

Course Description. This class addresses the representation, analysis, and design of discrete time signals and systems. The major concepts covered include: Discrete-time processing of continuous-time signals; decimation, interpolation, and sampling rate conversion; flowgraph structures for DT systems; time-and frequency-domain design techniques for recursive (IIR) and non-recursive (FIR) filters; linear prediction; discrete Fourier transform, FFT algorithm; short-time Fourier analysis and ...

In signal processing, sampling is the reduction of a continuous-time signal to a discrete-time signal. A common example is the conversion of a sound wave (a continuous signal) to a sequence of samples (a discrete-time signal).. A sample is a value or set of values at a point in time and/or space. A

Discrete-time and Statistical Signal Processing - Signal ...

A (one-dimensional) discrete-time signal is defined as a sequence of numbers, written as $x[n]$, with $n \in \mathbb{Z}$. It is written with square brackets to clearly differentiate it from a continuous signal $x(t)$, with $t \in \mathbb{R}$. Often, the discrete-time signal is a sampled version of a “real” continuous signal.
