## Forensics: Glass Fragment Analysis

Glass analysis can be helpful in various ways.

Glass fragments at a crime scene should always be collected and analyzed because several clues can be gathered about the events that occurred during the crime.

Glass fragments can provide very significant forensic evidence. Glass as a mass-produced material is widely distributed and fragments from broken glass can provide very strong evidence to support a scenario in a specific set of case circumstances. In general, the more parameters identified for the glass fragments, the stronger the evidence

As the size of the glass fragments decreases, properties such as colour and shape become harder to determine. For that reason, most forensic laboratories use either refractive index (RI) or elemental (chemical composition) analyses.

To pinpoint the source of the glass evidence, the forensic examiner needs the two usual samples: glass fragments collected from the crime scene and glass fragments taken from some item belonging to the suspect. The examiner must then compare these samples (often side-by-side via a stereomicroscope)

Glass fragments located at a crime scene can be essential to determining the identity and sometimes the location of a suspect.

However, in all cases, the forensic scientist is required to draw comparison samples and determine the class or category of the glass sample or glass fragment.
