Local Anesthesia In Dentistry Clinical

There are two local anesthetic agents used in dentistry that reportedly induce methemoglobinemia.

The first agent is the topical local anesthetic

benzocaine and the second agent is the injectable

(and topical) local anesthetic prilocaine. The

mechanism of action is that both of these anesthetics oxidize hemoglobin to methemoglobin.

(PDF) Local anesthetics in dental practice

Local anaesthetics are usually given by dentists, surgeons, anaesthetists, GPs and other doctors. Some medications containing mild local anaesthetic are also available on prescription or over the counter from pharmacies. Depending on what they're being used for, local anaesthetics can be given as injections, creams, gels, sprays or ointments.

Local anaesthesia - NHS

Though local anesthetics are safe and effective, considerable research is on-going to make them even more effective. Computer-controlled local anesthetic delivery systems (C-CLAD) and buffered local anesthetic solutions promise to allow painless injections to be delivered to dental patients almost anywhere in the oral cavity.
