Motor Control is the only text to bridge the gap between current motor control research and its applications to clinical practice. The text prepares therapists to examine and treat patients with problems related to balance, mobility, and upper extremity function, based on the best available evidence supporting clinical practice. This edition provides the latest research findings and their clinical applications in postural control, mobility, and upper extremity function. Drawings, charts, tables, and photographs are also included to clarify postural control and functional mobility, and laboratory activities and case studies are provided to reinforce key concepts. Videos on the back-of-book DVD examine motor control deficits, including deficits in postural control, mobility, and upper extremity function in different types of neurologic pathology (stroke, cerebellar pathology, cerebral palsy, and Parkinson's disease) as well as in balance impaired elders. These videos can be viewed in their entirety or in the following segments: impairments, postural control, mobility, and upper extremity control. This video enhances the clinical coverage found in the textbook.

This fully revised edition stresses the scientific and experimental bases of new motor control theories, and explains how principles can be applied to clinical practice. The book presents many theories of motor control, but focuses on a systems theory of motor control and a clinical or "task-oriented" approach to examination and intervention. Features include: laboratory activities to demonstrate concepts; a new chapter on impairments that constrain functional movement in patients with neurologic pathology; a revised section on manipulatory function disorders; and case studies to help readers apply concepts to patients with different diagnoses. All chapters include an outline, key terms, learning

boxes, and a summary.
