Generally, power electronic devices based on the AlGa_N/Ga_N heterojunction structure have the following four advantages: (1) the 2DEG with high carrier density and high carrier mobility reduces the on-resistance of the device and hence the conductive loss of the power switch. (2) At the same output power, the device area is much smaller for Ga_N HEMT.

PWM is a technique that is used to reduce the overall harmonic distortion (THD) in a load current. It uses a pulse wave in rectangular/square form that results in a variable average waveform value $f(t)$, after its pulse width has been modulated. The time period for modulation is given by T . Therefore ...
